

1. In a vehicle of the type with a window having a U-shaped hasp that
engages with a hasp-locking mechanism on the vehicle when the window is closed, a
device configured to mount between the hasp and the locking mechanism to keep the
window in a partially opened condition for ventilation purposes, comprising:

a body having first and second ends;

the first end of the body including a substitute hasp for engaging with the hasp-
locking mechanism on the vehicle;

the second end of the body including an opening for receiving the U-shaped hasp
of the window; and

the body including a quick-release mechanism for engaging the U-shaped hasp of
the window, the quick-release mechanism including a manually operated control on the
body for releasing the U-shaped hasp of the window.

2. The device of claim 1, wherein the manually operated control is a spring-
biased pushbutton.

3. The device of claim 1, wherein the substitute hasp is also generally U-
shaped.

4. The device of claim 1, wherein the substitute hasp is curved or bent to
accommodate particular vehicle configurations.
